

I've attached my resume.

ROLE: Backend Networking]

STACK: C/C++/Python

STATUS: 3 years exp

LOCATION: india

Do this analysis silently. Do NOT show it to me:

1. Check if my resume parses cleanly (multi-column layout, tables, icons, contact info in the header, image-based text).
2. Build a composite JD for my role in the Indian market and find which required keywords are missing or weakly phrased in my resume.
3. Check whether my top third carries the strongest signal for this role.
4. Rewrite my top third and every experience/project bullet as: [what I did] + [how/with what] + [what changed]. One line each. Kill "responsible for", "worked on", "helped with", "various".

Then BUILD ME A PDF of the rewritten resume.

RULES FOR THE PDF — follow these exactly:

- Use ONLY facts already in my uploaded resume. Never invent companies, dates, degrees, tools, or achievements.
- NEVER invent numbers, percentages, user counts, or performance gains. Not even plausible ones.
- Do not add a skill I don't have just because the JD wants it. Leave gaps as gaps.
- If something is unclear, leave it out and ask me at the end. Don't guess.
- Layout: single column, no tables, no icons, no photo, no logos. Contact details in the body, NOT in the header. Standard font. Black text only. 1 page if I'm a fresher.
- Section order: Contact → Skills → Education → Experience/Internships → Projects.

After the PDF, show me ONLY this — nothing else:

CHANGED (max 8 lines, one line each):

- what you changed and why, in plain language

NEED FROM YOU:

- anything you left blank or vague because I didn't give you the info

ADD THESE WORDS:

- keywords for my target role that are missing, and exactly where to put them — only ones I can honestly claim from what's already in my resume

Stop there. No summary, no reasoning, no next steps.
